Short Story - User Story In Detail

- Sharing a short story is a web portal where a user can share their personal short story. Admin can approve or reject the story shared by the user and in each case an email is sent out to the user. Once the story is approved, it will be available on the portal for all the users to read it.

Defining the **Objects & Relationship**

- **Objects**

- SSRole
- SSUser
- ShortStory

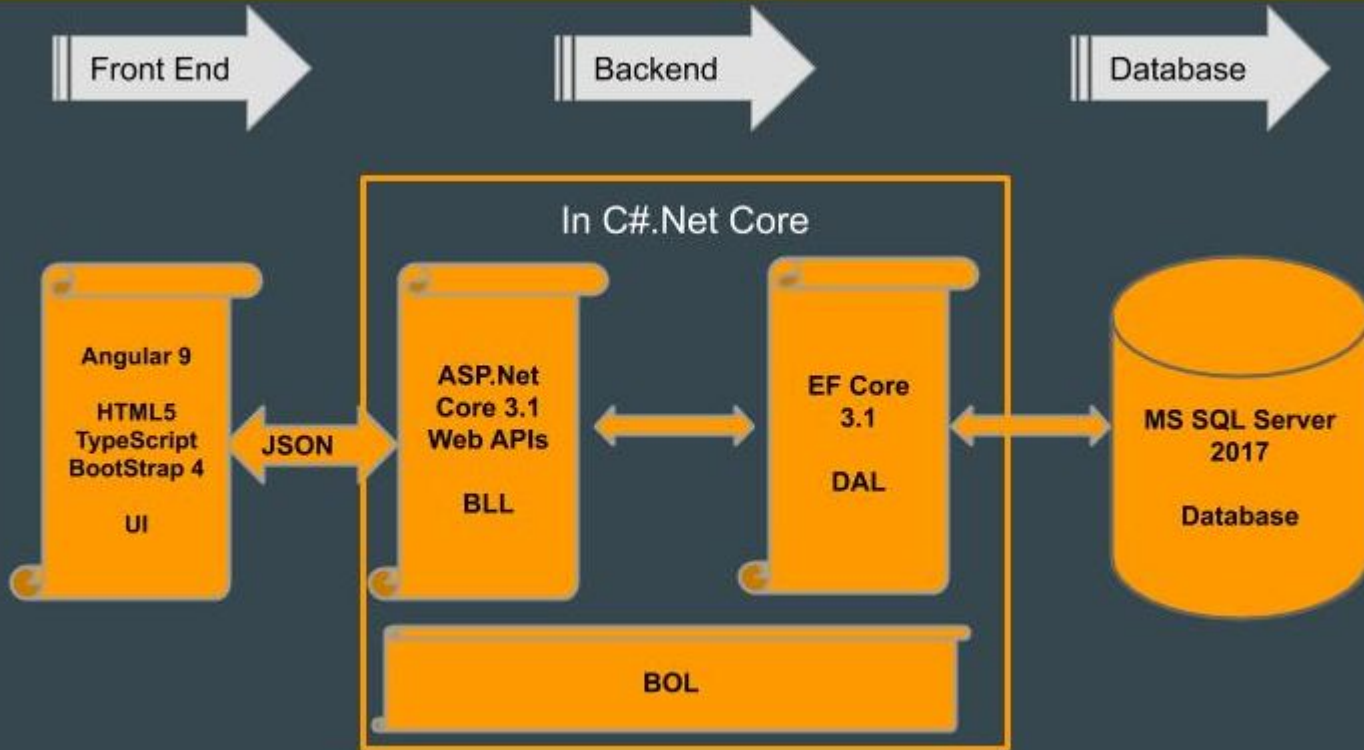

- **Relationship**

- SSRole : SSUser (1:M)
- SSUser : ShortStory(1:M)

Defining the Roles & Responsibilities

- Guest
 - Can register.
 - Can Login
- User
 - Dashboard
 - Share a story
 - Read the approved stories shared by other users.
- Admin
 - Can approve or reject the story shared by any user.

Design Project Arch.

To Do List - Backend

- BOL
 - IdentityRoles (no need to create class)
 - SSUser:IdentityUser
 - ShortStory
- DAL
 - SSDbContext
 - ShortStoryDb
- WebAPI+BLL
 - StoriesController
 - AccountController

To Do List - Frontend

- Directory Structure
 - Common
 - User
 - Admin
 - Services
 - Models
- Adding Components
 - Common → home, header, footer, register, login
 - User → postStory, readStories
 - Admin → approveStory
- Adding Services
 - commonApi
 - authApi
- Installing all the necessary packages
- Bootstrap
- Routing
- Components Implementation
- Final Touch
- Hosting it Live

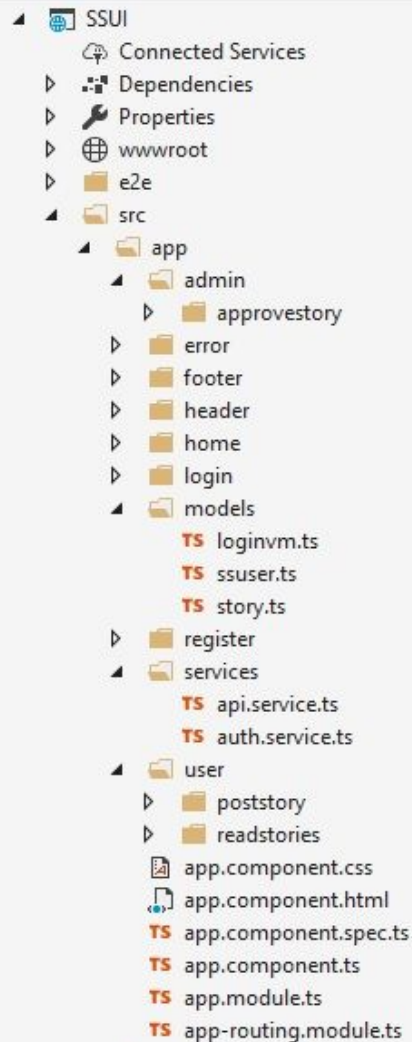

Creating UI With **Angular 11**

Angular CLI : Command Line Interface tool to initialize, develop, scaffold and maintain Angular applications.

1. Start an **empty ASP.Net Core** web application and **enable it for static files**
2. Open VS2019 command prompt in **admin mode** and Go to projects folder
3. Run this command -> **npm install @angular/cli --global** (Angular CLI Tool)
4. Run this command -> **ng new SSUI --skip-install** (To create project)
5. Move content of **app folder** to **project root folder**
6. Open **angular.json** file and set "outputPath": "wwwroot"
7. Run this command -> **npm install** (Install All the Packages)(Longer Time Step)
8. Run this command -> **ng build** (To build the project)
9. Run this command -> **ng serve** (To run the project and get dynamic updates)

Installing all the necessary packages

- Paging
 - → npm install --save ngx-pagination
 - → import { NgxPaginationModule } from 'ngx-pagination';
- Searching
 - → npm install --save ng2-search-filter
 - → import { Ng2SearchPipeModule } from 'ng2-search-filter';
- Sorting
 - → npm install --save ngx-order-pipe
 - → import { OrderModule } from 'ngx-order-pipe';
- Bootstrap
 - → npm install --save bootstrap jquery
- Local Storage
 - → npm install --save angular-web-storage
 - → import { AngularWebStorageModule } from 'angular-web-storage';

Components Implementation

- header
- footer
- app.component
- Routing Conf
- NgModule Config
- Models
- api Service Implementation
- postStory {reactive form}
- readStory
- approveStory

Reactive Forms

```
import { ReactiveFormsModule } from '@angular/forms'; // app.module.ts

import { FormBuilder, FormGroup, Validators } from '@angular/forms'; //component.ts

postStoryForm: FormGroup;

this.postStoryForm = this.fb.group({

  sstitle: ['', [Validators.required]],

  ssDiscription: ['', [Validators.required]]

});
```

Final Touch

- AuthService Constructor Update
- AuthGuardService
- Interceptors
- `npm install @ngx-loading-bar/core @ngx-loading-bar/http-client`
- `npm install @ngx-loading-bar/core @ngx-loading-bar/router`
- `npm install ng2-charts`
- `npm install chart.js`
- `npm install angular7-csv`

Google Login

Goto -> <http://console.developers.google.com> and get **ClientId** and **ClientSecret** by creating a project.
